Supplementary Fig. S1. Cross-species transcriptomic profiles underlying differential regenerative capacities, Related to Fig.1.

a Clonal expansion analysis of hPMSCs and dASCs. Quantitative data to the right are presented as the mean \pm SEM (Two-tailed unpaired Student's *t* test). *n* = 3 biological replicates. **b** Clonal expansion analysis of hPMSCs (passage 13, P13) cultured in fresh medium (FM) and dASC culture medium (dASC-CM) for three passages. Quantitative data to the right are presented as the mean \pm SEM (Two-tailed unpaired Student's *t* test). *n* = 3 biological replicates. **c** Ki67 staining of hPMSCs (P13) cultured in FM and dASC-CM for three passages. Quantitative data to the right are presented as the mean \pm SEM (Two-tailed unpaired Student's *t* test). *n* = 3 biological replicates. Scale bars, 25 μ m. **d** Representative tracks of RNA-seq data showing the RNA levels of *WRN* in WT and WS hMSCs (P9). **e** Western blot analysis of WRN levels in WT and WS hMSCs (P9). β -Actin was used as the loading control. **f** Clonal expansion analysis of WT and WS hMSCs (P9). Quantitative data to the right are presented as the mean \pm SEM (Two-tailed unpaired Student's *t* test). *n* = 3 biological replicates. **g** Wind-rose plot showing the count of DEGs in AB at DPA 11, young NHP tissues, and young hMSCs. **h** Bubble plot showing the enriched GO terms and pathways for upregulated DEGs in AB at DPA 11, young NHP tissues, and young hMSCs. The color key from white to red indicates low to high $-\log_{10}(P\text{-value})$. The bubble sizes are positively correlated to the relative enrichment levels.

c

Supplementary Fig. S2. Metabolomic profiles for cross-species models with differential regenerative abilities, Related to Fig.2.

a Wind-rose plots showing the count of identified metabolites in AB, dASCs, NHP tissues, and hMSCs. **b** Intra-tissue correlation heatmaps for metabolites in each tissue from young and old NHPs. The correlation coefficient ρ from negative to positive is shown from blue to red. **c** Network diagram showing the representative sub-pathways associated with “Fatty Acid Metabolism (Acyl Carnitine)” and relative abundance for DPMPs for each sub-pathway in AB at DPA 11, dASCs, young NHP tissues, and young hMSCs. The color of the edge from black to amaranth indicates $\log_2(\text{fold change})$ from low to high. The node sizes are positively correlated to the edge counts for each node.

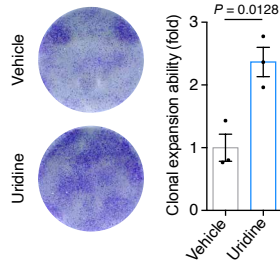

Supplementary Fig. S3. Transcriptional regulation of metabolic pathways associated with regenerative capacities, Related to Fig.2.

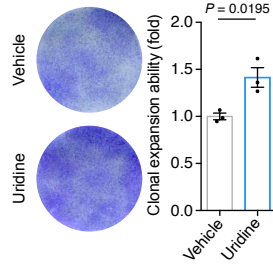

a Heatmap showing the enriched metabolic pathways based on the interplay analysis of transcriptome and metabolome data. Integrated pathway analysis of transcriptomic and metabolomic data were conducted by the MetaboAnalyst web tool based on the upregulated DEGs and increased DPMPs in samples with higher regenerative potential. The color key from white to amaranth indicates $-\log_{10}(P\text{-value})$ from low to high. **b** Network diagram showing the differential levels for DEMGs and DPMPs in pyrimidine metabolism sub-pathway in samples with higher regenerative potential. The color of the edge from black to amaranth indicates $\log_2(\text{fold change})$ from low to high. The node sizes are positively correlated to the edge counts for each node. The DEMGs and DPMPs of pyrimidine metabolism enriched in AB at DPA 11, young WAT, kidney and young hMSCs are shown. **c** Network diagram showing the enriched transcription factors (TFs) for DEMGs in samples with higher regenerative potential. The color of the edge from white to black indicates enrichment level (Normalized enrichment level, NES) for TF from low to high. The color of the node from white to amaranth indicates count of enriched target genes for the corresponding TF. “# of enriched samples (n)” means the count of enriched models for indicated TF. TFs enriched in at least two types of samples with higher regenerative potential are shown. **d** Protein-protein interaction network showing the interaction of the enriched TFs for DEMGs in samples with higher regenerative potential. TFs enriched in at least four types of samples with higher regenerative potential were retained for protein-protein interaction analysis. The color of the edge from white to amaranth indicates the interaction score from low to high. Protein-protein interaction was calculated by STRING database (<https://cn.string-db.org>) and visualized by Cytoscape. **e** Network diagrams and heatmaps showing the relative expression levels for genes in PPAR signaling pathway. The color key of the heatmap from blue to amaranth indicates the relative expression levels [$\log_2(\text{fold change})$] of indicated genes from low to high. Heatmap cells marked by * indicate significantly changed DEGs.

Supplementary Fig. S4. Uridine treatment enhances hMSC activity, Related to Fig.3.

a Left, clonal expansion analysis of vehicle- and uridine (200 μ M)-treated WS hMSCs (P5) at P2 post treatment. Middle, clonal expansion analysis of vehicle- and uridine (100 μ M)-treated HGPS hMSCs (P10) at P2 post treatment. Right, clonal expansion analysis of vehicle- and uridine (100 μ M)-treated hPMSCs (P13) at P2 post treatment. Data are presented as the mean \pm SEM (Two-tailed unpaired Student's *t* test). *n* = 3 biological replicates. **b** Left, immunostaining of Ki67 in vehicle- and uridine (100 μ M)-treated HGPS hMSCs (P10) at P2 post treatment. Right, immunostaining of Ki67 in vehicle- and uridine (100 μ M)-treated hPMSCs (P13) at P2 post treatment. Data are presented as the mean \pm SEM (Two-tailed unpaired Student's *t* test). *n* = 3 biological replicates. Scale bars, 25 μ m. **c** Cell cycle analysis of vehicle- and uridine (100 μ M)-treated HGPS hMSCs (P10) at P2 post treatment. Data are presented as the mean \pm SEM (Two-tailed unpaired Student's *t* test). *n* = 3 biological replicates. **d** Left, immunostaining of H3K9me3 in vehicle- and uridine (200 μ M)-treated WS hMSCs (P5) at P2 post treatment. Middle, immunostaining of H3K9me3 in vehicle- and uridine (100 μ M)-treated HGPS hMSCs (P10) at P2 post treatment. Right, immunostaining of H3K9me3 in vehicle- and uridine (100 μ M)-treated hPMSCs (P13) at P2 post treatment. Dashed lines indicate the nuclear boundaries of the cells with decreased H3K9me3 signals. Data are presented as the mean \pm SEM (Two-tailed unpaired Student's *t* test). *n* = 3 biological replicates. Scale bars, 25 μ m. **e** Left, RT-qPCR analysis of transcripts from indicated repetitive elements in vehicle- and uridine (200 μ M)-treated WS hMSCs (P5) at P2 post treatment. Middle, RT-qPCR analysis of transcripts from indicated repetitive elements in vehicle- and uridine (100 μ M)-treated HGPS hMSCs (P10) at P2 post treatment. Right, RT-qPCR analysis of transcripts from indicated repetitive elements in vehicle- and uridine (100 μ M)-treated hPMSCs (P13) at P2 post treatment. Data presented as the mean \pm SEM (Two-tailed unpaired Student's *t* test). *n* = 4. **f** Left, immunostaining of γ H2A.X and 53BP1 in vehicle- and uridine (200 μ M)-treated WS hMSCs (P5) at P2 post treatment. Middle, immunostaining of γ H2A.X and 53BP1 in vehicle- and uridine (100 μ M)-treated HGPS hMSCs (P10) at P2 post treatment. Right, immunostaining of γ H2A.X and 53BP1 in vehicle- and uridine (100 μ M)-treated hPMSCs (P13) at P2 post treatment. Dashed lines indicate the nuclear boundaries of the γ H2A.X and 53BP1 double positive cells. Data are presented as the mean \pm SEM. (Two-tailed unpaired Student's *t* test). *n* = 3 biological replicates. Scale bars, 25 μ m.

Supplementary Fig. S5. Single-nucleus transcriptomic profile of muscle regeneration model, Related to Fig.4.

a UMAP plots showing the different cell types (left) and cells of muscle tissues from sham mice and mice treated with vehicle or uridine (right). Adi, adipocyte; FAST IIA, type IIA fast-twitch muscle fiber; FAST IIX, type IIX fast-twitch muscle fiber; Mixed, mixed type IIA/ IIX fast-twitch muscle fiber; MuSC, Muscle satellite cell; FAP, fibro-adipogenic progenitor; Ten, Tendon fibroblast; Tnc-Fib, *Tnc*-positive fibroblast; EC, endothelial cell; Per, pericyte; M1, pro-inflammatory macrophage; M2, anti-inflammatory macrophage; NMJ-PMF, neuromuscular junction-postsynaptic muscle fiber. **b** Dot plot showing the representative marker gene in each cell type. **c** Top, heatmaps showing the distribution of DEGs of cell types comparing between SMI (Vehicle) and Sham groups, and SMI (Uridine) and SMI (Vehicle), respectively. Each row represents one cell type, and each column represents one gene. Rescue DEGs are the genes that exhibited the opposite changes upon injury and uridine treatment. Bottom, GO term and pathway enrichment analysis for rescue DEGs. The color keys from white to red or blue indicate $-\log_{10}(P\text{-value})$ from low to high. **d** Pharmacokinetic characteristics of plasma uridine concentrations in mice ($n = 15$ mice) after intraperitoneal administration (200 μL of 4 mg/mL uridine in 0.9% NaCl). Blood samples were serially taken, and the uridine concentrations were determined by liquid chromatography-tandem mass spectrometry. Each sample was technically repeated for 6 times, and the mean value was taken for statistical analysis. Data are presented as the mean \pm SEM (Two-tailed unpaired Student's t test). **e** Schematic diagram showing the working model for cross-species and cross-ages metabolomic analysis and metabolites screening identified uridine as a key metabolite reinforcing regeneration in multiple mouse tissues.

Description of Supplementary Tables

File Name: Supplementary Table S1

Description: Information for overlapping discriminatory metabolites elevated in samples with higher regenerative potentials.

File Name: Supplementary Table S2

Description: Detailed information of metabolites screening assays.

File Name: Supplementary Table S3

Description: The sequences of primers used in this study.

File Name: Supplementary Table S4

Description: List of antibodies used in this study.
